### Caramatic BasicControl – Remote display for Caramatic BasicTwo two-cylinder system

#### What is Caramatic BasicControl?

BasicControl is an information and control unit which is used in caravans and motor caravans as well as on boats. Campers and boat captains can thus monitor both the operating cylinder and reserve cylinder in the gas system.

Available from February 2022

#### Where can I use the Caramatic BasicControl?

The system is suitable for the Caramatic BasicTwo two-cylinder system, an automatic regulator changeover for connection to gas cylinders to supply LPG to motor caravans, caravans and boats. BasicControl can be easily retrofitted to existing systems. The housing is clipped onto the changeover regulator and the sensor is inserted into the pipe system. Finally, the cable is connected to the information and control unit and the user can see whether there is still gas in the gas cylinders or which of the two gas cylinders is empty.

#### What are the benefits?

- Convenient gas system monitoring at a glance – with no need to open the gas cylinder case
- Always know whether and, if so, which of the two gas cylinders is empty and needs to be changed
- Simple and quick retrofitting for existing systems
- Error displayed by flashing LED
